Population based cancer registries provided individual core data. Quality control checks, tabulations and statistical analysis were done at the Coordinating Unit of NCRP, Bangalore.

The publications of NCRP are intended to contribute to the dissemination of authentic information on cancer incidence by age (Five-year age groups), sex and site (ICD-10).

FORWARD

The two year 1999-2000 report of the population based cancer registries is the outcome of efforts made by registries under the National Cancer Registry Programme (NCRP) of the Council. The report includes data from five urban and one rural cancer registry under the NCRP. These five urban registries are located at Bangalore, Bhopal, Chennai, Delhi and Mumbai and the rural registry is at Barshi in the state of Maharashtra.

The reports of the NCRP have over a period of time become the standard work of reference not only within our country but abroad as well. Besides providing information on what type of cancer is occurring where and what is the magnitude, these reports have contributed a base for deciding priorities in cancer control programmes in India.

The NCRP is nearing twenty years of systematic scientific collection of data. With the availability of the recent population figures from the 2001 census it is hoped that by the end of the year, NCRP will be able to provide time trends in the occurrence of cancer.

To collate, make checks and prepare quality report takes time. With advances in information technology efforts are under way to shorten the gap between calendar year of data and year of report publication.

It is hoped that this publication will serve as a ready reference on cancer incidence in India for researchers, clinicians, health administrators and others interested in this field.

The registries and all of their staff, deserve thanks for the work they have put in and making available their data.

National Cancer Registry Programme

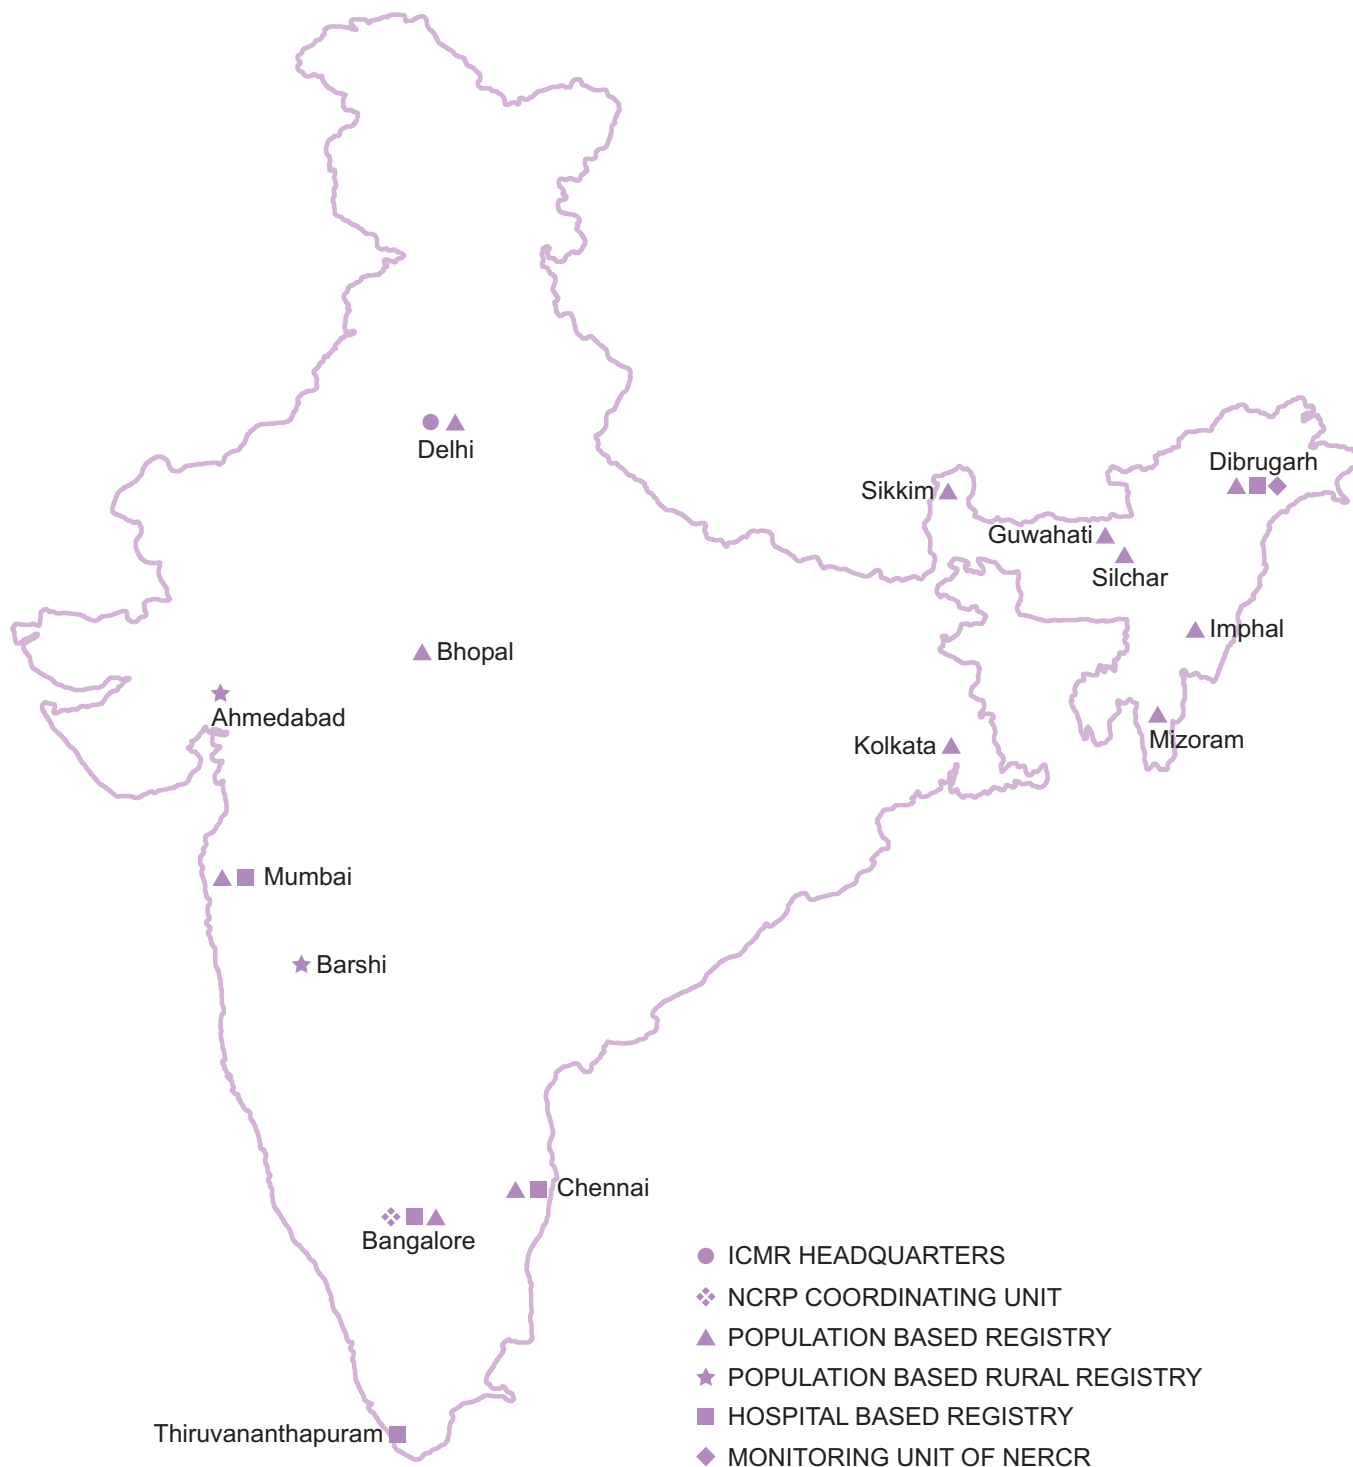

Under the National Cancer Registry Programme (NCRP), the Indian Council of Medical Research commenced a network of cancer registries across the country in December 1981 with the objectives of

1. Generating reliable data on the magnitude and patterns of cancer - this would be based on morbidity and mortality information in different regions of the country according to sex, age and residence of the patient, anatomical site of cancer and proportion of histological type or microscopic confirmation for each site; pattern of different types of cancer according to relative proportions or ratios in various population sub-groups such as religion, language spoken, educational status; clinical stage of disease when patients come to hospital for treatment and where possible the nature of treatment received and outcome;
2. Undertaking epidemiologic research, such as case control or cohort studies based on observations of registry data;
3. Providing data base for developing appropriate strategies to aid in National Cancer Control Programme; this would be in the form of planning, monitoring and evaluation of activities under this programme;
4. Developing human resource in cancer registration and epidemiology.

Data collection commenced from 1 January 1982 in the population based cancer registries at Bangalore, Chennai and Mumbai, and also in the hospital based cancer registries at Chandigarh, Dibrugarh and Thiruvananthapuram. In order to extend the assessment of cancer patient care, hospital based cancer registries were also started at Bangalore, Chennai and Mumbai in 1984. From 1986 two more urban population based cancer registries were started in Delhi and Bhopal, the latter to determine the effect of Methyl Isocyanate gas exposure on the occurrence of cancer. For the first time a population based rural cancer registry was started in 1987 in Barshi in the state of Maharashtra. To ensure uniformity in the data collected by different registries, code manuals separately for HBCRs (NCRP, 1987) and PBCRs (NCRP, 1987) were prepared. These code manuals are used for the data from 1st January 1986. Under the auspices of the World Health Organization, a project on "Development of an Atlas of Cancer in India" was commenced in 2001. As a fallout of this, a North Eastern Regional Cancer Registry (NERCR) has been commenced in six areas at Guwahati, Dibrugarh and Silchar in Assam, Aizawl in Mizoram, Imphal in Manipur and Gangtok in Sikkim with a Monitoring Unit at Regional Medical Research Centre, Dibrugarh. These registries have started collation of information on cancer cases from 1 January 2003. One more population based rural cancer registry was commenced from 1 January 2003 to cover Ahmedabad rural district. From 1 February 2005 the urban PBCR of Kolkata was included in the NCRP network to cover Kolkata Municipal Corporation. The map of India depicting the locations of the various cancer registries is shown in the adjoining page.

NATIONAL CANCER REGISTRY PROGRAMME

(Indian Council of Medical Research)

The NCRP is a long-term activity of the Indian Council of Medical Research. The programme is one of the many major activities of the Division of Non-Communicable Diseases and an Officer-in-charge coordinates it. The Programme is assisted by a Steering Committee that meets periodically to oversee and guide its functioning. A review meeting is held annually, where the Principal Investigators and staff of the registries under the NCRP, present data and participate in the discussions. This meeting is preceded by a workshop. With the objectives of discussing the various aspects of working of the registry, problematic cases, use of coding and discussion on medical terminology, statistical and epidemiologic methods. About 2-3 senior and junior staff from each of the registries under the NCRP, participate in the workshop.

Cancer registration in India is active. Staff of registries visit hospitals on routine basis and scrutinise the records in various departments that include pathology, radiology, radiotherapy, in-patient wards and out-patient clinics to elicit the desired information on reported cancer cases in a “common core proforma” that has been standardised for all cancer registries in India. Coding of the disease is done according to International Classification of Diseases (WHO, ICD-10). This facilitates comparison of our data with that from registries across the world. In addition, to facilitate the detailed histologic studies, coding is also done according to International Classification of Disease for Oncology (WHO, 3rd Edition 2002). The hospitals include the main cancer hospitals, other general hospitals in both the government and private sector. Besides, pathology laboratories that routinely report cancer cases are also visited. Death certificates are also scrutinised from the municipal corporation units. Every attempt is made by registries to visit all hospitals and register all cancer patients in the registration area who are resident (at least one year) in the area and to also copy all death certificates in which cancer is mentioned as an antecedent or immediate cause.

Certain basic checks of data, especially those related to duplicate verification and matching with mortality records, are carried out by the individual registries. After this, the data is sent to the Coordinating Unit for subjecting the data to various range, consistency and unlikely combinations including a further round of possible duplicate listing. The list of cases with the items of patient information, that require verification are sent to the respective registries by the Coordinating Unit. Individual registries go through the records/reports of such cases and wherever necessary discuss with the concerned clinician or the pathologist. On receiving the clarifications, the Coordinating Unit prepares the detailed tabulations by five-year age group, site and sex, including rates. The individual registries use these tables to prepare the registry’s annual report. The Coordinating Unit collates the data and perform tabulations to prepare the consolidated report of that year.

Apart from the above, the Coordinating Unit undertakes and coordinates epidemiologic and other research studies, including those to ensure that the quality of data is of a high standard and that coverage of cancer cases in the registry area is as complete as possible.

Over the years, staff from registries under the NCRP, have benefited from both short and long term training fellowships in established institutions abroad. This has helped them and the registries to develop into departments of epidemiology and undertake several studies on their own and contribute to several research publications in indexed journals.

Two-year Report of the Population Based Cancer Registries: 1999-2000

Incidence and Distribution of Cancer

INTRODUCTION AND SUMMARY OF THE REPORT

Cancer Registration is a process of continuing, systematic collection of data on the occurrence and characteristics of reportable neoplasms (MacLennan *et al*, 1978). Cancer registries could be Population based (PBCR) or Hospital based (HBCR) or developed for a special purpose in relation to specific exposures like the Bhopal PBCR. They could also be related to a specific anatomical site like bone tumour or morphology like lymphoma registry or a particular age group like childhood cancer registry.

The basic purpose of a PBCR is cancer in the community. The PBCRs provide information on cancer incidence and mortality, time trends of these rates and variations in patterns. They also provide population based cancer survival rates. The PBCRs form a platform for carrying out research investigations on cancer aetiology through case control or cohort studies. To initiate, establish and sustain PBCRs as per international norms requires meticulous planning, cooperation of medical institutions in the area, dedicated and committed personnel and adequate funding. There are many source of registrations from where staff of registries, collect information on cancer cases. These include pathology reports, medical records, radiology and radiotherapy departments and death certificates. The availability of up-dated investigation/diagnostic facilities, well maintained medical records using International Classification of Diseases together with an efficient death registration system are essential for completeness as well as good quality cancer registration.

In India cancer is not a notifiable disease. Therefore, the methodology of data collection by the registries is active. Registry staff, regularly and periodically visit various sources of registration to actively pursue and collect information on cancers reported and interview patients wherever possible. The advent of computing technology and the age of electronic information processing is gradually transforming the working of registries in India. On line checks including duplicate checks of data on the web-site ncrpindia.org have been developed.

Studying the magnitude and patterns of cancer helps in determining clues to the cause of cancer and undertake studies in disease aetiology. Epidemiologic studies based on these help in knowing what is happening and what can be done about it. Cancer registries provide the needed information to undertake such investigations.

The previous consolidated report of the PBCRs published in 2003 was of the two year data for the years 1997 and 1998 of the five urban (Bangalore, Bhopal, Chennai, Delhi and Mumbai) and one rural (Barshi) population based cancer registry. The present report covers the data of the above registries for the years 1999 and 2000. It seeks to emphasize cancer incidence and patterns of cancer in the areas covered by these registries. It attempts to give clues to the burden and patterns of cancer in these areas so as to provide a base for studies in cancer causation and its control.

Though the geographic area and population covered (about 3%) by the PBCRs are small compared to the vastness of India and its population, they give a fair idea of the cancer problem especially in urban centres in the country. This report is the culmination of sustained efforts made by the cancer registries.

Chapter 1 gives an idea of the cancer incidence in the registry areas. Cancer incidence rate is generally expressed as age-adjusted (AAR) or age-standardized (according to world standard population) incidence rate per 100,000 persons. For all anatomical sites in urban males the AAR varied from 97.8 to 119.8 and in females from 109.6 to 126.7. As in earlier years incidence rates in the rural registry of Barshi were lower (45.0 in males and 54.2 in females).

Chapter 2 provides a picture of the leading sites of cancer in the different PBCRs. Overall, among males as in the previous report cancer of the lung is numerically the number one cancer. It is the leading site in Delhi, Mumbai and Bhopal, second and third leading site in Chennai and Bangalore respectively. Another site of cancer associated with the use of tobacco, namely, cancer of the oesophagus is an important leading site in both males and females. As in the reports of earlier years, cancer of the stomach in males continues to be the leading site of cancer in the southern registries of Chennai and Bangalore. In women, cancers of the cervix and breast, together accounted for over 40-45% of cancers in urban women and over 55% of cancers in the rural registry in Barshi. Lymphoreticular malignancies as a group are a very important set of neoplasms. They comprise over 10% of malignant neoplasms, have a potential for cure and are of interest in terms of aetiology and epidemiology.

Chapter 3 gives the salient statistics of cancers associated with use of tobacco. These sites of cancer account for 35 to 50% of all sites of cancer in males and 9.9-15.6% of all cancers in females.

Chapter 4 deals with the basis of diagnosis of cancer. The relative proportion of different methods of diagnosis of cancer viz., microscopic, imaging, clinical etc. along with cases with DCO as the basis of diagnosis are given.

Chapter 5 gives an account of the mortality data. There are certain limitations in the collection of mortality data. These include the system of registration of death and certification of the cause of death. Though in urban centres all deaths are generally registered, information on exact cause of death is lacking. When cancer is mentioned as a cause, the anatomical site is not mentioned and when the site is mentioned the histology or morphology is not stated. Because of this, there are difficulties in having a clear and

complete picture of cancer mortality as opposed to cancer morbidity. However, traditionally Mumbai has developed a relatively better system mainly because of the earlier Coroner's act. Chennai registry and more recently Bhopal have made extra efforts to enlist deaths due to all causes and trace back these deaths to elicit cause.

The authenticity of the data depends on its quality, and with reference to the PBCRs, this would be both in terms of completeness of coverage of cancer cases in the geographic area as well as the reliability of the data. Registries routinely undertake various exercises to ensure that the data they collate and process is of high quality. A thorough check of data is also done before tabulation and these aspects are dealt in detail in Chapter 6. The Coordinating Unit has now developed an on-line check programme that can be carried out by the registries through the NCRP website (ncrpindia.org).

Chapter 7 lists the definitions and statistical methods followed.

The detailed individual registry write up and annexure tabulations are provided in Part II of the report. The annexure tabulation for numbers and rates (incidence and mortality) are provided for both the years 1999 and 2000 separately and in combination.

PART - I

Chapter 1

POPULATION AND CANCER INCIDENCE

The major concern of the Population Based Cancer Registry (PBCR) is to calculate cancer incidence rates, study the rates of individual cancers by comparing cancer incidence and patterns, in other registries and in different subgroups of the population in respective areas. The definition and details of these calculations are given in further Chapters.

Geographical area and population at risk

Table 1.1 illustrates the geographical area, the number of male and female population covered by the six respective PBCRs. The population covered ranges from 5.02 lakhs in Barshi to 122.11 lakhs in Delhi registry. Table 1.2 provides the total number of cancers registered in different registry areas.

Cancer Incidence - All sites (ICD10: C00-C96)

Cancer incidence refers to new cancers diagnosed in a given population during a specified time period. Incidence data in this report is based on cancers diagnosed during the period of 1st January 1999 to 31st December 2000. Table 1.2 shows the number of cancers registered during that period. The numbers registered from different registry areas were 424 (Barshi); 1799 (Bhopal); 7578 (Bangalore); 8142 (Chennai); 17581 (Mumbai) and 18234 (Delhi).

In Bhopal, Delhi and Mumbai the number of male cancers were higher than in females. In Bangalore, Barshi and Chennai male cancers were less compared to females. Overall, from six registries 53,758 cancers were registered out of which 26,666 (49.6%) were males and 27,092 (50.4%) were females.

Table 1.3 and Fig. 1.1 provide the Crude (CR), Age Adjusted (AAR) and Truncated Cancer Incidence Rates (TR) of the six registries.

Crude Incidence Rate (CR)

The highest CR per 100,000 was observed in Chennai (92.5) followed by Mumbai (68.9), Delhi (68.1), Bhopal (63.3), Bangalore (60.1) and Barshi (38.8). Similarly, among females the highest CR per 100,000 was observed in Chennai (103.0) followed by Mumbai (83.0), Delhi (81.6), Bangalore (77.5), Bhopal (62.8) and Barshi (45.8).

Age Adjusted Incidence Rate (AAR)

In males, the AAR per 100,000 ranged from 45.0 in Barshi to 119.8 in Bhopal. Among the six PBCRs, Bhopal had the highest AAR but in terms of CR it was the fourth highest.

Among females, the AAR ranged from 54.2 in Barshi to 126.7 in Chennai. Again the order observed among the registries for AAR was different from that observed for crude rates.

FEMALES

Truncated Incidence Rate (TR)

In males, the TR per 100,000 ranged from 68.7 in Barshi to 208.3 in Chennai. Similarly in females it ranged from 101.4 in Barshi to 269.9 in Chennai.

Age Specific Incidence Rates

The gravity of the problem can be assessed from the graph of average annual age specific incidence rates for all sites of cancer using the arithmetic scale. The log scale is used to measure trends.

Figures 1.2 (a) and (b), show that age specific incidence rates increase with increase in age in all registries. Further, after 45 years of age, the average annual age specific cancer incidence rate seems to increase appreciably in males. In females the increase is appreciable after 30 years of age.

Cumulative Rate and Risk

Day (1987) proposed the cumulative rate as another age standardized incidence rate.

The cumulative risk is the probability that an individual will be diagnosed with cancer during a certain age period in the absence of any competing cause of death and assuming current trends prevail over the time period.

For practical purposes, the cumulative rate is a good approximation of the cumulative risk over the defined period of time. This can be estimated from the age specific incidence rates either for the five-year age group from 0-64 years or 0-74 years. Since the average life expectancy of the population of India has gone up, one will have to examine the estimates obtained from both the calculations. In this report, 0-64 and 0-74 years are used as an approximation to an average lifetime for estimating the cumulative rate and risk.

Cumulative Risk (%) in 0-64 years

Among males, except for the rural registry of Barshi the cumulative risk ranged from 5.2% in Bangalore to 7.3% in Chennai. This cumulative risk (%) gives an idea about a person developing cancer during the life period of 0-64 years e.g. like in Bangalore 5.2% of males in the age group 0-64 are likely to develop cancer during their life time.

Among females, the cumulative risk (%) ranged from 7.6% in Mumbai to 8.9% in Chennai. This means on an average about 8% of females in the 0-64 years of age are likely to develop cancer during their life time. In Barshi the cumulative risk was 3.5%.

Cumulative Risk (%) in 0-74 years

Among males, in Barshi the 0-74 age group cumulative risk percentage was 5.3%. In other registries, the cumulative risk percentage ranged from 11.0% in Bangalore to 14.5% in Bhopal.

Among females, the cumulative risk percentage ranged from 11.8% in Bhopal to 13.7% in Mumbai. However in Barshi cumulative risk percentage was 6.3%.

Delhi	13.13	14.61	12.31	13.59	8	7
Mumbai	13.83	14.70	12.92	13.67	8	7

In both males and females the cumulative risk (%) in the 0-74 age group was almost double that seen in the 0-64 age group.

Both the cumulative rate and cumulative risk of different registries are tabulated in Table 1.4 for both the 0-64 and 0-74 years age group.

Chapter 2

LEADING SITES OF CANCER

The leading sites of cancer for each gender were decided on the basis of proportion relative to all sites of cancer or in other words based on crude incidence rates. Tables 2.1 to 2.6 and Figures 2.1 to 2.6 show the ten leading sites of cancer for both males and females in the six registries.

BANGALORE

Table 2.1 provides the list of ten leading sites of cancer seen in the area of Bangalore registry. It also provides the respective CR, AAR and TR per 100,000. Figure 2.1 shows the ten leading sites of cancer for both males and females in this registry.

Males: The leading sites of cancer (with relative proportion in parentheses) in Bangalore were stomach (9.4%), oesophagus (8.5%), lung (7.6%), prostate (5.8%), hypopharynx (4.5%) and others. Accordingly the CR and AAR per 100,000 for these sites (given in parentheses) were stomach (5.66 and 9.54), oesophagus (5.11 and 8.99), lung (4.59 and 8.05), prostate (3.44 and 6.58) and hypopharynx (2.68 and 4.75).

Females: The leading cancer sites among females were breast (22.1%) followed by cervix (18.7%), oesophagus (5.5%), ovary (5.0%), mouth (4.8%) and others. The two major leading sites (breast and cervix) constituted over 40% of the total cancers. The CR and AAR per 100,000 were breast (17.16 and 26.80), Cervix (14.53 and 23.26), oesophagus (4.26 and 7.61), ovary (3.90 and 5.99) and mouth (3.73 and 6.20).

BARSHI

Table 2.2 provides the number of cases along with the CR, AAR and TR per 100,000 of ten leading sites of cancer in Barshi registry. Figure 2.2 shows the ten leading sites of cancer for both males and females.

Males: The leading sites of cancer (with relative proportion in parentheses) were hypopharynx (10.9%), oesophagus (7.9%), liver (5.9%), rectum (5.5%) and stomach (5.5%). Accordingly, the CR and AAR per 100,000 for these sites (given in parentheses) were hypopharynx (4.22 and 5.22), oesophagus (3.07 and 3.69), liver (2.30 and 2.84), rectum (2.11 and 2.48) and stomach (2.11 and 2.51).

Females: Cervix (43.24%) was the leading site of cancer in the Barshi registry area. The other leading sites were breast (12.2%), oesophagus (5.9%), rectum (3.2%) and other skin (2.7%). Accordingly, the CR and AAR of the leading sites were cervix (19.80 and 23.41), breast (5.57 and 6.77), oesophagus (2.68 and

3.22), rectum (1.44 and 1.77) and other skin (1.24 and 1.45) respectively. Cervix and breast constituted over 55% of all cancers.

BHOPAL

The ten leading sites of cancer of Bhopal registry along with its CR, AAR and TR per 100,000 are listed in Table 2.3. Figure 2.3 shows the ten leading sites of cancer for both males and females.

Males: The leading sites of cancer (with relative proportion in parentheses) were lung (11.0%), tongue (9.1%), oesophagus (7.6%), mouth (7.6%) and hypopharynx (5.6%). Accordingly, the CR and AAR per 100,000 for these sites (given in parentheses) were lung (6.98 and 14.04), tongue (5.79 and 10.69), oesophagus (4.79 and 9.96), mouth (4.79 and 8.35) and hypopharynx (3.53 and 7.38).

Females: The leading sites of cancer (with relative proportion in parentheses) were breast (24.4%), cervix (21.4%), mouth (6.1%), ovary (4.5%) and gallbladder (4.4%). Accordingly, the CR and AAR per 100,000 for these sites (given in parentheses) were breast (15.35 and 25.54), cervix (13.42 and 24.40), mouth (3.86 and 7.70), ovary (2.82 and 4.96) and gallbladder (2.74 and 5.64). The two major sites of cancer, namely breast & cervix constituted over 45% of all cancers.

CHENNAI

Total numbers of cases of ten leading sites of cancer along with their CR, AAR & TR are tabulated and shown in Table 2.4 for both the sexes. Figure 2.4 shows the ten leading sites of cancer for both males and females.

Males: The leading sites of cancer (with relative proportion in parentheses) in Chennai registry were stomach (11.4%), lung (9.2%), oesophagus (8.3%), mouth (5.1%) and hypopharynx (4.8%). Accordingly the CR and AAR per 100,000 for these sites (given in parentheses) were stomach (10.56 and 13.53), lung (8.50 and 11.29), oesophagus (7.71 and 10.23), mouth (4.70 and 5.97) and hypopharynx (4.39 and 5.85).

Females: The leading sites of cancer (with relative proportion in parentheses) in Chennai registry were cervix (25.2%), breast (22.5%), ovary (5.2%), oesophagus (4.7%) and stomach (4.6%). Accordingly, the CR and AAR per 100,000 for these sites (given in parentheses) were cervix (25.93 and 32.32), breast (23.17 and 27.98), ovary (5.32 and 6.44), oesophagus (4.80 and 6.30) and stomach (4.73 and 5.88). The two leading sites of cancer, the cervix and breast constituted 47.7% of all cancers.

DELHI

The ten leading sites of cancer at Delhi with its CR, AAR and TR per 100,000 are tabulated under Table 2.5. Figure 2.5 shows the ten leading sites of cancer for both males and females.

Males: The leading sites of cancer (with relative proportion in parentheses) in Delhi registry were lung (9.6%), larynx (6.8%), prostate (5.3%), NHL (5.2%) and tongue (5.1%). Accordingly, the CR and AAR per 100,000 for these sites (given in parentheses) were lung (6.55 and 12.24), larynx (4.67 and 8.32), prostate (3.57 and 7.83), NHL (3.57 and 5.34) and tongue (3.48 and 5.87).

Females: The leading sites of cancer (with relative proportion in parentheses) in Delhi registry were breast (25.1%), cervix (16.4%), ovary (7.2%), gallbladder (6.6%) and oesophagus (2.7%). Over 41% of all the cases were contributed by breast and cervix cancer. Accordingly, the CR and AAR per 100,000 for

these sites (given in parentheses) were breast (20.54 and 31.52), cervix uteri (13.22 and 20.45), ovary (5.84 and 8.80), gall bladder (5.36 and 9.06) and oesophagus (2.20 and 3.97).

MUMBAI

Table 2.6 shows the ten leading sites of cancer of Mumbai registry along with its CR, AAR and TR per 100,000. Figure 2.6 shows the ten leading sites of cancer for both males and females.

Males

The leading sites of cancer (with relative proportion in parentheses) in Mumbai registry were lung (9.1%), oesophagus (5.9%), mouth (5.9%), larynx (5.9%) and prostate (5.7%). Accordingly, the CR and AAR per 100,000 for these sites (given in parentheses) were lung (6.23 and 11.71), oesophagus (4.08 and 7.45), mouth (4.07 and 6.15), larynx (4.07 and 7.39) and prostate (3.92 and 8.92).

Females

The leading sites of cancer (with relative proportion in parentheses) in Mumbai registry were breast (25.7%), cervix uteri (14.3%), ovary (6.7%), oesophagus (4.2%) and mouth (3.4%). Accordingly the CR and AAR per 100,000 for these sites (given in parentheses) were breast (21.34 and 31.54), cervix (11.86 and 17.43), ovary (5.52 and 7.94), oesophagus (3.44 and 5.77) and mouth (2.82 and 4.57).

A comparison of inter registry rates suggests that among males, lung cancer was the leading site in Bhopal, Delhi and Mumbai, whereas in Chennai and Bangalore, lung cancer was the second and third leading site of cancer respectively. Cancer of stomach was the leading site in Bangalore and Chennai whereas it occupied different positions in other registries. In Barshi, cancer of hypopharynx was the leading site. In all registries, cancer of oesophagus and tongue were among the leading sites of cancer.

In females, breast cancer was the leading site of cancer in Mumbai, Delhi, Bhopal and Bangalore ranging from 22% to 26% of all cancers in females and second leading site in Chennai and Barshi. In Barshi, cancer cervix constituted 43.2% of all cancers in females. Cancer of cervix was the leading site in Chennai also. The other registries like Bhopal, Bangalore, Delhi and Mumbai have cervical cancer as the second leading site of cancer. Ovarian cancer was one of the leading sites of cancer in all the six registries.

In most of the registries, sites of cancer like Non-Hodgkin's Lymphoma and Brain were one among the ten leading sites of cancer in both males and females.

The leading sites of cancer in this report are based on ICD-10 whereas the previous reports were based on ICD-9. Therefore, some minor differences could occur when comparing leading sites of cancer in the different reports.

CANCER SITES ASSOCIATED WITH USE OF TOBACCO

According to the International Agency for Research on Cancer Monograph (IARC,1987), sites of cancer that have been associated with use of tobacco (TRC) include lip, tongue, mouth, pharynx (including oropharynx and hypopharynx), oesophagus, larynx, lung and urinary bladder. Recently, International Agency for Research on Cancer Monograph (IARC 2004) states, that, there is now sufficient evidence to establish a causal association between cigarette smoking and cancers of the nasal cavities and nasal sinuses, oesophagus (Adenocarcinoma), stomach, liver, kidney (Renal Cell Carcinoma), uterine cervix and myeloid leukaemia apart from the sites in the earlier monograph IARC,1987).

Table 3.1 illustrates number and relative proportion of TRCs (IARC 1987) of different PBCRs.

TABLE 3.1 : Number (#) & Relative Proportion (%) of TRCs (IARC 1987)

Delhi	3398	37.03	899	9.93
Mumbai	3620	40.77	1327	15.25

The number and proportion of TRC relative to all sites of cancer is tabulated (as per IARC, 1987) and provided under Table 3.2. Figure 3.1 illustrates the total proportion of TRC relative to all sites. Among males, the highest relative proportion (%) of TRC was seen in Bhopal (50.0%), followed by Mumbai (40.8%), Chennai (40.6%), Barshi (38.6%), Delhi (37.0%) and Bangalore (35.4%). In females, the relative proportion (%) of TRC ranged from 9.9% in Delhi to 15.4% in Bangalore.

Table 3.3 and Figure 3.2 illustrate the number and relative proportion of different sites of cancer among tobacco related cancers. Among the TRC sites the three leading sites were lung, oesophagus and hypopharynx that contributed almost 45% to 60% of the total TRC in different registries. In females, the three leading sites were oesophagus, mouth and lung, that contributed 64% to 77% of the TRC in different registries.

BASIS OF DIAGNOSIS

Table 4.1 provides the number and relative proportion of cancers based on different methods of diagnosis. In males, Barshi registry (87.1%) has the highest proportion of cases diagnosed microscopically followed by Bhopal (85.8%), Bangalore (84.4%), Mumbai (81.3%), Delhi (80.4%) and Chennai (73.5%). Cases observed through Death Certificate Only (DCO) ranged from 0.5% in Barshi to 6.6% in Mumbai. Clinically diagnosed cases ranged from 1.9% in Bhopal to 13.3% in Delhi.

In females, Bhopal registry (92.6%) had the highest proportion of cancer cases confirmed microscopically followed by Bangalore (86.2%), Barshi (86.0%), Mumbai (82.8%), Chennai (80.7%) and Delhi (77.6%). Cases obtained through DCO ranged from 0.5% in Barshi to 6.6% in Mumbai. Clinically diagnosed cases ranged from 1.8% in Bhopal to 16.6% in Delhi.

Table 4.2 illustrates the proportion of different types of microscopic diagnosis. Among the cancers diagnosed microscopically, primary histology constituted 75.7% in Delhi to 87.6% in Chennai followed by cytology (3.1% in Chennai to 11.8% in Bangalore). In females, the percentage of cases diagnosed by primary histology varied from 67.5% in Delhi to 90.9% in Chennai. The percentage of cases diagnosed by cytology varied from 5% in Bhopal to 21% in Delhi.

The Relative Proportion (%) of cancers based on different methods of diagnosis are represented in Fig. 4.1(a & b). Fig. 4.2 (a & b) shows the relative proportion (%) of different types of microscopic diagnosis.

CANCER MORTALITY

Registries visit municipal corporation units to collect information regarding reported cancer deaths. For this they also visit vital statistics division and further obtain information on cancer deaths from hospitals and institutions.

In the death registration / vital statistics units or during the scrutiny of death registers in medical institutions, the registry staff complete a standard proforma for the cases that had cancer mentioned in the death certificate. The proforma includes identifying information, registration number, place of registration, death registry number, place of death (whether medical institution, residence or elsewhere or unknown), cause of death, histopathology report, date of death, the background of the person certifying the death (whether allopathic practitioner or otherwise, coroner, others like panchanamas or unknown), and wherever available name and address of the institution or practitioner certifying the death. It also includes obtaining the residential status of the deceased (whether resident of registry area or otherwise) and the residential address. Details on cancer deaths of persons not residing in the registry area are excluded.

The information on deaths so collected is compiled and matched with incident/morbidity data of all the days, months and years prior to the date of death of the individual. These constitute the matched deaths for that particular year. The unmatched deaths are included with that particular year's incident/morbidity data and constitute the category "Death Certificate Only".

Cancer mortality rate is defined as the number of cancer deaths per 100,000 population occurring in a defined population, in a defined geographical area during a particular year. The age adjusted mortality rate is similar to the age adjusted incidence rate where the mortality rate is adjusted to the standard world population. Like the age specific incidence rates the age specific mortality rates are also calculated and this could be site and gender specific.

Table 5.1 shows the incidence cases, mortality cases and mortality incidence percent (MI%) of all sites of cancer in the six registries. The M/I% was found to be highest in Barshi (76.2%) followed by Mumbai (48%), Chennai (44.8%), Bangalore (34.5%), Bhopal (29.4%) and Delhi (15.2%).

In females, M/I% ratio was again found to be the highest in Barshi (81.5%) followed by Mumbai (41.3%), Chennai (34.1%), Bangalore (25.9%), Bhopal (22.9%) and Delhi (11%).

Crude Mortality Rate (CMR), Age Adjusted Mortality Rate (AAMR) and Truncated Mortality Rate (TMR) per 100,000 are shown in Table 5.2. Crude Mortality Rate was highest in Chennai (41.5) followed by Mumbai (33.1), Barshi (29.6), Bangalore (20.7), Bhopal (18.6) and Delhi (10.4).

Similarly, in females the highest CMR was observed in Barshi (37.3), followed by Chennai (35.1), Mumbai (34.3), Bangalore (20.0), Bhopal (14.4) and Delhi (8.9).

Table 5.3 gives the number of matched deaths and total deaths. In males the number of deaths due to cancer for the registry of Bangalore, Barshi, Bhopal, Chennai, Delhi and Mumbai were 1207, 154, 280, 1775, 1395 and 4264 respectively. Among these the percentage of matched deaths for above registries were 84.3%, 99.4%, 88.9%, 94.3%, 79.4% and 86.2% respectively.

Among females, the number of deaths for different registries like Bangalore, Barshi, Bhopal, Chennai, Delhi and Mumbai were 1057, 181, 194, 1424, 993 and 3592 respectively. The percentage of matched deaths for above registries were 82.7%, 99.5%, 92.8%, 92.8%, 75.9% and 84% respectively.

The age specific mortality rates of six registries for males and females are portrayed in Fig. 5.1 (a) and (b).

Fig. 5.2(a) to 5.2(f) illustrates the age specific incidence and mortality for all sites of cancer, in the six registries for both sexes.

DATA QUALITY AND INDICES OF RELIABILITY

The cancer registry is a source of information. Quality is a property of the data and a product of the techniques used to create them. The quality of information is a product of the quality of the data and the quality of their presentation. The five main areas of consideration of quality in a PBCR are,

- 1. Completeness of coverage:** to obtain information on all cancers diagnosed in the population so as to ensure a high degree of case ascertainment;
- 2. Adequacy of data:** to have certain core and critical items of patient information on all cases;
- 3. Accuracy of data:** to ensure that data are free from erroneous abstraction, coding, data entry etc.;
- 4. Comparability of data:** to adopt information techniques in coding, classification etc., that would assure comparability internally and externally;
- 5. Reliability of data:** to ensure reliability of data through periodic audits.

Along with the above objectives, the registries routinely undertake various exercises to ensure that the data they gather and process is of high quality. Based on the publication “Comparability and Quality Control in Cancer Registration” published by the International Agency for Research on Cancer (Parkin *et al*, 1994) and suitably modified so as to be practically applicable for the set-up of the cancer registries under the NCRP, these exercises include:

- 1. Details of sources of registration:** To minimize duplicate registrations at an early stage and identify number of cases whose residential status including duration of stay remains unknown, a comprehensive account of the various sources of registration is obtained. The latter helps in pinpointing sources and the channels of referral of these resident unknown cases where greater efforts are made to minimize such cases. This exercise also helps in knowing the number of sources of registration per case - an index to assess coverage.
- 2. Notification per case:** By notification per case is meant, the different types of reports confirming the diagnosis of cancer in a given case. For example, a patient with a lump in the breast could initially have fine needle aspiration cytology, followed by a biopsy and finally a mastectomy specimen, with all three reports having evidence of malignancy. Notifications per case give an idea of the diagnostic work-up and mechanics of reporting while also providing an indirect measure of completeness of coverage.
- 3. Re-abstraction of Random Sample:** All registries regularly re-abstract a ten percent random sample of cases. This is done by supervisory staff, and the core proforma is completed afresh for all these cases, without reference to the original abstracts. Differences between original and re-abstracted data are tabulated and categorized into minor and major disagreements, justifiable disagreements and errors. The above tabulations are prepared by all registries and presented and discussed in the NCRP workshops every year. Overall such re-abstraction errors have been less than five percent.

4. Range and Consistency Checks: Besides data entry and other checks carried out by the registries, the Coordinating Unit has developed a comprehensive software programme which checks the quality of the data online. This quality control involves range checks, consistency checks, duplicate checks and unknown primary site checks.

Apart from the above steps, within the data itself, there are certain indices of reliability. These include the proportion of microscopic verification, the proportion of cases categorized as “Death Certificate Only” and the Mortality Incidence Ratio.

Proportion of Microscopic Verification

This is an indicator of the validity of diagnostic information (Parkin *et al*, 1994).

Death Certificate Only

These are cases for which there is no other information other than a death certificate with cancer mentioned as a cause of death. These cases are obtained through the death registration units etc and cannot be matched with any of the registered cases. To some extent the proportion of these cases reflect the proportion of cancer cases that could possibly be missed by the registry. Generally such cases should be minimal.

Mortality Incidence Ratio

As described in Chapter 5, the mortality incidence percent (M/I%) is another important indicator of completeness. In general, in cancers with very poor survival such as cancer of liver, the M/I% will be close to 1 (or 100%). Cancers with better survival like breast cancer would have figures less than one.

Table 6.1 provides information on Proportion of Microscopically Verified Cases, Proportion of DCOs and Mortality Incidence percent. The microscopic verified cases in males ranged from 73.5% in Chennai to 87.1% in Barshi. The maximum of M/I% was found in Barshi (76.2%) followed by Mumbai (48%), Chennai (44.8%), Bangalore (34.5%), Bhopal (29.4%) and Delhi (15.2%).

In females, the Proportion of Microscopic Verified Cases ranged from 92.6% in Bhopal to 77.6% in Delhi. The maximum of M/I% was found in Barshi (81.5%) followed by Mumbai (41.3%), Chennai (34.1%), Bangalore (25.9%), Bhopal (22.9%) and Delhi (11.0%).

Chapter 7

DEFINITIONS, STATISTICAL TERMS AND METHODS USED IN CALCULATIONS

Cancer Case: All neoplasms with a morphology behaviour code of '3' as defined by the International Classification of Diseases – Oncology, (Third edition) are considered reportable and therefore registered.

Age-Group: According to WHO guidelines for estimating population and grouping cancers the convention in using five year age group i.e, 0-4, 5-9, 10-14, ..., 75+.

Incidence Cases: Cancer incidence refers to new cases diagnosed in a given population in a specified period of time. For this report all cancers diagnosed from 1 January 1999 to 31 December 2000 in different geographic areas covered by the six population based cancer registries, are included.

Rates: Rates for cancer are always expressed per 100,000 population.

Crude Incidence Rate (CR): This rate is expressed per 100,000, obtained by dividing the number of new cases by the corresponding estimated population (mid-year) and multiplying by 100,000.

$$CR = \frac{\text{New cases of cancer of a particular year}}{\text{Estimated population of the same year}} \times 100,000$$

Age Specific Rate (ASpR): For a specified five-year age group and sex the age specific rates are the annual number of cases per 100,000 people in the population of that age and sex.

$$ASpR = \frac{\text{New cases of cancer of a particular year in the given age group}}{\text{Estimated population of the same year for the given age group}} \times 100,000$$

Age Adjusted or Age Standardised Rate (AAR): Mostly occurrence of cancer increases as age increases. Therefore high proportion of older population implies higher number of cancers. Most developed and western countries have a higher proportion of older population. So in order to make rates of cancer comparable between developed and developing countries a world standard population (given below) that takes this into account is used to arrive at age adjusted or age standardised rates and applying these

rates to the standard population in that age group. The world standard population approximates the proportional age distribution of the world and is given below:

Age Group	World Standard Population
0 – 4	12,000
5 – 9	10,000
10 – 14	9,000
15 – 19	9,000
20 – 24	8,000
25 – 29	8,000
30 – 34	6,000
35 – 39	6,000
40 – 44	6,000
45 – 49	6,000
50 – 54	5,000
55 – 59	4,000
60 – 64	4,000
65 – 69	3,000
70 – 74	2,000
75 +	2,000
All Ages	100,000

$$\text{AAR} = \frac{\sum_{i=1}^A a_i w_i}{\sum_{i=1}^A w_i}$$

where:

a_i is the age specific rate (AspR) in age class i ;

w_i is the world standard population in age class i ;

A represents the number of age intervals.

(or) expressed in more simpler terms thus:

$$\text{AAR} = \frac{\sum (\text{AspR}) \times (\text{No. of persons in Std. world population in that 5 yr. age group})}{100,000}$$

Cumulative Risk: This is the probability that an individual will be diagnosed with or die from cancer during a certain age period in the absence of any competing cause of death and assuming current trends prevail over the age period. The cumulative rate is an approximation of the cumulative risk. It is obtained by adding the age specific incidence rates for each five year age interval (up to 64 or 74 years of age) multiplied by 5 (representing the five year age interval) times 100 per 100,000.

$$\text{Cumulative Rate} = \frac{5 \times \sum(\text{ASpR}) \times 100}{100,000}$$

and Cumulative Risk is expressed as,

$$\text{Cumulative Risk} = 100 \times (1 - \exp(-\text{Cumulative Rate} / 100))$$

Truncated Age Adjusted Rate (TR): Similar to age adjusted rate except that it is calculated for the truncated age group of 35-64 years of age.

Coding Manual: The coding manual (NCRP, 1987) has been used by all registries, in abstracting cancer patient information, coding of the same and data entry on to the computer.

Based on the Census Populations of 1991-2001, the Growth Rates were calculated using the formula,

$$P_{2001} = P_{1991} (1 + (r/100))^{10}$$

where P_{2001} is the population total of 2001,

P_{1991} is the population of 1991 and

r is the annual growth rate.

Utilizing the annual growth rate obtained from above formula, the populations for the year 1999 and 2000 were estimated. The Census Population for the year 1991 and 2001 were obtained referring to the CD (C Series: C-6 by five Year Age Groups and Sex) and the Census website* (Table-2: Population, Population in the age group 0-6 and Literates by Residence and Sex - India, States/UN & Districts-2001) respectively.

POPULATION BASED CANCER REGISTRY, BANGALORE Kidwai Memorial Institute of Oncology, Bangalore

Dr P.S. Prabhakaran, Principal Investigator and Director, KMIO

Dr K. Ramachandra Reddy, Co-Principal Investigator & Head

The Population Based Cancer Registry at Kidwai Memorial Institute of Oncology was established during June 1981 with the main objective of assessing the magnitude and type of various cancers in Bangalore and this registry was named as 'Bangalore Cancer Registry'. The required base-line information such as area to be covered along with its boundaries, its population, list of medical institutions (Govt. & Pvt.), Labs, vital statistics unit etc., were collected during the year of establishment. Later in December 1981, this registry was included under the network project of National Cancer Registry Programme (NCRP) of Indian Council of Medical Research (ICMR) and the actual registration of cancer cases were commenced from 1st January 1982.

Bangalore is the Capital City of Karnataka State in Southern India. It is situated between 13° North and 78° East at an altitude of 931 metres above the sea level. The Population Based Cancer Registry of Bangalore covers an area of 365.7 sq.kms which has an estimated population of 5.5 million as of 1999-2000. The coverage area namely "Bangalore Urban Agglomeration" consists of Bangalore Mahanagara Palike (divided into 100 wards) and 8 adjoining City Municipal Councils apart from 25 death registration units. The registration of cancer cases is done by active registration method. The sources of data collection includes all government hospitals, private hospitals, nursing homes, diagnostic laboratories and death registration units besides the base Institution. The Asst. Social Scientists of the Registry visit these places and collect information on cancer cases by interviewing them wherever possible in case of patients being admitted in wards and if not, extract the information required from the medical records. At Kidwai Memorial Institute of Oncology, each and every patient registered will be interviewed at their first presentation to the Hospital and collects socio-demographic details. Later the case records of these patients would be obtained to the registry to extract information on clinical items such as method of diagnosis, stage of disease, site of cancer, treatment details etc. The inclusion criteria for registration of cases is that, such cases should have been lived in Bangalore Urban Agglomeration for atleast a year at the time of first diagnosis of cancer. Only invasive cancers (5th digit morphology code of "3" or "6") are reported. Benign tumors and in-situ cancers are not included for analysis.

During the period 1999-2000, a total number of 7578 incident cases have been registered with 3495 males and 4083 females. The male-female ratio of incident cases being 0.86:1. The average annual crude (CR) & Age-adjusted (AR) (world standard population) incidence rates were 60.1 and 97.8 among

males and 77.5 and 122.7 among females respectively per 100,000 persons. The common cancers among males were cancers of the stomach (9.4%) followed by oesophagus (8.5%), lung (7.6%), lymphoma (6.5%) and oral cavity (6.4%). Among females breast cancer was the predominant type of cancer and accounted for 22.1% of the total female cancers followed by cancer of the cervix (18.7%), oral cavity (5.9%), oesophagus (5.5%) and ovary (5.0%).

Paediatric cancers accounted for about 3% of all cancer in both sexes with a slight male preponderance than females. Tobacco related cancer sites accounted for 35.4% of all cancers in males and 15.4% of all cancers in females. The mortality to incidence ratio was 30.2%.

(The proportion of cases registered with death certificate only sources was 4.9%).

The Rural Cancer Registry: Barshi, Paranda & Bhum, which was set up in 1987, is the first Rural Cancer Registry in the country.

The registry area comprises rural areas of three sub-districts in western India viz. Barshi in Solapur district and Paranda & Bhum in Osmanabad district, situated in the vicinity of Nargis Dutt Memorial Cancer Hospital (NDMCH), (located on the outskirts of Barshi town), with a total population of about 0.4 million in 346 villages spread over 3713 Sq. km. The village is the basic administrative unit in rural areas and is defined as having greater than 25% of the male working population engaged in agricultural activities, a population of less than 400 persons per Sq. km. and a total population of generally less than 5000. The registry area is situated between latitudes 17.1° & 18.4° N longitudes 76° and 76.4° E. Most of the population are Hindus (96%), Muslims accounting for 3% and other religious groups 1%. Diagnosis and treatment facilities within the area itself are almost non-existent. The villagers seek care from various centres even as far as 400 kms.

The registry is jointly funded by the Tata Memorial Centre, Mumbai and the Indian Council of Medical Research, New Delhi. The diagnostic and treatment facilities are provided by NDMCH with technological support from Tata Memorial Hospital.

The usual method of registration has been modified to overcome deficiencies in diagnostic services in the rural setting. Trained field investigators visit the villages regularly and interact with the rural community to identify and motivate likely cancer cases to visit NDMCH for early diagnosis and treatment. To screen symptomatic cases, cancer detection clinics are held biannually in each of the 12 zones, into which the Registry area is divided. Data on cancer cases from the area are also collected from various hospitals and histopathological laboratories (situated far & wide), which serve the population. However 60% of cases are registered from NDMCH to which the field investigators generally refers the suspected cases.

Information on deaths is collected from village death records and also directly from the local community (during village visits). As deaths are not generally medically certified, relatives of all deceased are contacted to collect relevant information to assist in 'follow back' to the medical records in the treating hospital or physician to identify proven cancer cases. The diagnostic charges for all patients from the registry area are borne by the Registry and for disadvantaged patients the treatment is given by NDMCH for free.

The registry activities have enhanced cancer awareness in the population and this has resulted in improved stage at diagnosis and improved 5-year survival in cervical cancer (1,2).

As we have been interacting with the Registry population for almost two decades, the cancer awareness as mentioned earlier has increased and now the literacy rates have also improved. We are considering reducing the Registry inputs to collect cases directly from the community in that we now plan to make only one round of village visits every year instead of two, hold mega clinics and extend our work to an additional tehsil, probably in Beed.

Quality Control

Quality control checks formulated by the National Cancer Registry Programme and International Agency for Research on Cancer are carried out routinely.

The data are evaluated for completeness by conducting annual house-to-house survey in a sample of villages. The indications are that a diagnosed case is not likely to be missed by the registry. However there is likely to be under-registration due to undiagnosed cases by registry. The under-registration is because the cases do not reach any of the diagnostic centres and medical records by the private practitioners are almost non-existent.

POPULATION BASED CANCER REGISTRY, BHOPAL

Gandhi Medical College, Bhopal

Dr V. K. Bharadwaj, Principal Investigator

Dr S. Surange, Research Officer

Dr R. Dikshit, Research Officer

Mr A. Shrivastava, Research Officer

A chemical disaster caused by the leakage of toxic gases from the Union Carbide factory in Bhopal on the night of 3rd December 1984 led to massive mortality and morbidity in the city. Methyl isocyanate (MIC) was supposed to be the major content of the toxic gases, which caused the disaster. Immediately after this tragedy, Indian Council of Medical Research initiated many studies to evaluate the ill effects of the toxic gases among the gas exposed population. Along with these studies, a special Population Based Cancer Registry was established at Bhopal to ascertain the magnitude of cancer problem in central India and to evaluate the carcinogenic effects of MIC. The registry started functioning from January 1986 with the objective of registration of all cancer cases residing in Bhopal urban area. Long term objective of this special registry is to study the Methyl Isocyanate gas exposed population of Bhopal for possible carcinogenic effects.

Bhopal is situated on the Arera Hills at an altitude of 505 metres above the sea level. It is situated 23.07° North and 77.12° East with a total area of 284.90 Sq. km. The density of population as per 2001 Census is 4755.46 / Sq. km.

The information is obtained on all cancer patients diagnosed in 63 medical centres, dispensaries, primary health centres and pathological laboratories. The social workers visit these centres and collect data by interviewing the cases whenever possible or from medical records. The data thus collected is entered on computers and various range and consistency checks are performed. Duplicate checks are carried out both by using computers and manually.

Over the years the registry has observed a very high incidence of tobacco related cancers with a rising trend of oral cavity and lung malignancies among males. Among females high incidences of breast and genital malignancies have been recorded. Cancer of breast has shown a rising trend.

Death registration system in Bhopal is far from adequate resulting in under registration of cancer mortality. Efforts to improve the mortality statistics using burial grounds and crematoriums data have been taken up since 2003. All deaths irrespective of the cause of death mentioned are noted and then matched with the morbidity data. The matched deaths are then updated. The unmatched cancer deaths are traced back by house visits and scrutiny of medical records. Cases with no other details, other than those available on the death certificate, are registered as "Death Certificate Only". Significant improvement has already been observed.

- * 1. Institutions listed have registered at least one percent of all cases in the registry for the combined years 1999-2000.
- * 2. The numbers and proportion listed are the minimum number of cases. Institutions could have registered / reported more cases, since duplicate registrations and non-resident/registry cases are not included.

POPULATION BASED CANCER REGISTRY, CHENNAI

The Madras Metropolitan Tumour Registry (MMTR), a Population Based Cancer Registry, was established at the Cancer Institute (W.I.A) in 1981 in the network of National Cancer Registry Programme (NCRP) of the Indian Council of Medical Research (ICMR), New Delhi, to study the pattern and trend of cancer incidence and mortality in Chennai City (formerly Madras). The data collection commenced from 1st January 1982.

The Chennai city is situated at sea level on the eastern coast of peninsular India at latitude 13.04° N and longitude 80.17° E. The MMTR caters to an area of 170 km² and an estimated population (entirely urban) of 4.3 millions (951 Females to 1000 Males) as on 1st July 2004. The decadal population growth rate during 1991-2001 was 9.76% and the population density was estimated to be 24,231 persons/km². The literacy rate is 80% (M: 85%; F: 75%), and the predominantly spoken language is Tamil. The majority are Hindus (84%) followed by Muslims (9%), Christians (6%) and the rest belonging to the other religious groups (1%).

General health care, including cancer diagnostic and treatment facilities, are provided by the government health services, the Cancer Institute (WIA), which is a Regional Cancer Centre in Ministry of Health and Family Welfare, Government of India and supplemented by private practitioners and hospitals. The Radiation Oncology division at the Cancer Institute (WIA), is one of the best equipped centres in India. Radiation facilities are also available in four Government and four private hospitals. Surgical and Chemotherapeutic services are offered in government and private hospitals and nursing homes.

Cancer is not a notified disease in India. Therefore registration of cases is done by active method. The registry continues to enjoy good cooperation from all health care facilities in and around Chennai with greater than 210 sources of registration till date: government and private hospitals, nursing homes, clinics, consultants, pathology laboratories, imaging centres and hospices. The principal criterion for the inclusion of cases in the registry is that the cases should have been residing in Chennai for at least a year at the time of first diagnosis of cancer. The Social Investigators of the registry visit the collaborating hospitals regularly and collect data on cancer by interviewing the cases wherever possible and/or from medical records. Deficient medical records are updated by the linkage of data collected from various departments within a hospital for completeness of details. Mortality information on all deaths occurring in the city, irrespective of the stated cause of death in the death certificate, is collected from the Vital Statistics Division (VSD) of the Corporation of Chennai. The completeness of registration of cancer cases in MMTR is estimated to be 96%. Management of data has been progressively computerized to minimize the manual work resulting in the enhancement of data quality. Reliability of data and quality of registration are constantly monitored with emphasis on re-abstraction and coding on a random sample of cases and validity checks

using IARC and other in-house developed computer programs. The fact that the data has been accepted for publication in the IARC publication Cancer Incidence in Five Continents, Vol VIII, without any reservation stands testimony to high level of data quality.

The MMTR, has been the first among the registries of NCRP in carrying out many new registry activities: in undertaking systematic trace-back of cancer cases first identified through a death certificate, in the form of visits to houses and relevant hospitals since 1983; in collecting information on the vital status (alive/dead) of the cases for selected cancer sites by active follow up since 1985; in collecting information on all deaths (cancer or not as the cause of death) from VSD since 1992.

The achievements based on such activities are plentiful. Survival analysis of the top ten cancers was first made available by MMTR among all other registries in NCRP. The availability of mortality information of incident cancer cases was “doubled” leading to an enhancement in the mortality to incidence ratio. The dissemination of cancer information is done by publishing reports on cancer incidence and mortality highlighting the trends and patterns periodically in national/international monographs and scientific journals.

Imparting training in “Principles and Techniques in Cancer Registration” to the students of the IARC courses, delegates from other regional cancer centres and personnel from other medical institutions and cancer registries has become a regular feature. MMTR also provides data on non-residents for the ICMR project on “Development of an Atlas of Cancer in India” and follow up for the IARC project on survival from top ten cancers in Chennai. The MMTR has started a systematic registration of cancer cases (diagnosed from the year 2003) from the entire district of Dindigul in Tamil Nadu through the Dindigul Ambilikkai Cancer Registry (DACR) catering to an estimate population of more than 2 millions. The DACR is expected to provide valuable information on rural incidence pattern in Tamil Nadu.

* 1. Institutions listed have registered at least one percent of all cases in the registry for the combined years 1999-2000.

* 2. The numbers and proportion listed are the minimum number of cases. Institutions could have registered / reported more cases, since duplicate registrations and non-resident/registry cases are not included.

POPULATION BASED CANCER REGISTRY, DELHI Institute Rotary Cancer Hospital, All India Institute of Medical Sciences, New Delhi

Dr Kusum Verma, MD(Path.), MIAC, FAMS,

Professor and Head of Pathology, AIIMS, Delhi and Principal Investigator, Delhi Cancer Registry

Dr B.B. Tyagi, M.Sc., Ph.D, Scientist - IV, Delhi Cancer Registry

Mr N. Manoharan, M.Sc., P.G.D.C.A., Scientist - I, Delhi Cancer Registry

The Population Based Cancer Registry (PBCR) at Dr. B.R. Ambedkar Institute Rotary Cancer Hospital, AIIMS, New Delhi was established in January 1986 with the aim of obtaining reliable morbidity and mortality cancer data among the Delhi residents.

Dr. Vinod Raina, Professor of Medical Oncology, Dr. B.R. Ambedkar Institute Rotary Cancer Hospital, AIIMS, New Delhi become the Professor in-charge of the Delhi Cancer Registry from 1st September 2004.

Delhi is a densely populated urban metropolis with an area of 1483 sq.kms, situated between the Himalayas and the Aravalli range in the heart of Indian sub-continent. It lies between 28° 25' and 28° 53' North latitude and 76° 50' and 73° 20' East longitude. Its maximum length is 51.90 kms and greatest width is 48.48 kms. It is surrounded on the north, west and south by Haryana and the east by Uttar Pradesh. The Delhi for the purpose of census was divided into 4 tracts viz.:-

- (I) Delhi Municipal Corporation (Urban)
- (II) New Delhi Municipal Committee
- (III) Delhi Cantonment and
- (IV) 29 Census towns

According to 2001 census the population of Delhi is 1,37,82,976 with 3.81% annual growth rate and 46.31% decennial growth rate during 1991-2001. The sex ratio in Delhi is 821 females per 1000 males. The literacy rate is 82% (Male: 87%; Females: 75%). The density of population is 9294 persons per sq. kms.

As per Population Census 1991 the total area of Delhi is 1483 sq. kms and its rural and urban composition are 797.66 sq. kms and 685.34 sq. kms respectively.

During Population Census 2001, the area of NCT of Delhi has remained the same at 1483 sq. kms. However, its rural-urban composition has undergone change. According to provisional results released by Directorate of Census Operations, Delhi, rural-urban break-up of N.C.T of Delhi is 591.91 sq. kms and 891.09 sq. kms respectively.

So, the PBCR, Delhi covers an area of 891.09 sq. kms comprising a population of 1,28,19,761 (Males: 70,30,671; Females: 57,82,090) as per 2001 census. The registry collects morbidity and mortality data on cancer patients from 159 major Government Hospital/centres/Institutions, more than 250 private hospitals and nursing homes, and the Department of Vital Statistics of the Delhi Municipal Corporation, New Delhi Municipal Committee and the Cantonment Board.

There has been no change in cancer registration system, methodology, diagnostic criteria and working of the registry from the previous years.

POPULATION BASED CANCER REGISTRY, MUMBAI Indian Cancer Society, Mumbai (Bombay)

Dr A.P. Kurkure, Principal Investigator

Dr B.B. Yeole, Deputy Director and Co-Investigator

The Bombay Cancer Registry was established in June 1963 as a unit of the Indian Cancer Society at Bombay, with the aim of obtaining reliable morbidity and mortality data on cancer from a precisely defined urban population (Greater Bombay). The actual compilation of the data began in 1964. Until then, registration of cancer cases in a population had not been undertaken anywhere in India. Initially the registry functioned in collaboration with Biometry Branch of the National Cancer Institute of USA and also received financial support from the branch till 1975. From 1976 to 1980 financial support was received from the Department of Science and Technology, Government of India and the Indian Cancer Society. Since 1981-82, the registry became part of the National Cancer Registry Programme under the Indian Council of Medical Research.

Information is obtained on all cancer patients diagnosed in 150 government hospitals/ institutions and private hospitals/nursing homes in Bombay, which are under the care of specialists, i.e., surgeons, physicians, pathologists, radiologists and gynecologists. Many hospitals in Bombay are maintained by the Municipal Corporation and the State Government, which are responsible for the organization of public health care and medical services in the city. The major source of the data is the Tata Memorial Centre, which is a postgraduate teaching hospital. The city has seven medical colleges. The diagnosis and treatment of cancer is centralized in certain hospitals. Cancer surgery is undertaken in the bigger hospitals and well-equipped private nursing homes. Facilities for Cobalt-60 therapy are available in nine hospitals.

General medical practitioners are not contacted individually as, according to local practice, only specialists assume charge of cancer patients in private hospitals and nursing homes and even few patients who are not admitted for hospital care are at some stage referred to specialist.

Staff of registry, visit the wards of all collaborating hospitals, at least once a week, to interview each cancer patient as well as those suspected having cancer. All files maintained by various departments of these hospitals are also checked. Care is taken to prevent duplication of an entry relating to a patient already registered.

Supplementary information is gleaned from the death records maintained by the Municipal Corporation. This makes it possible to check on missed cases. Every cancer death not traceable to an entry in the files is labeled as unmatched death and is so registered for the corresponding year.

The registry covers the resident population of Greater Bombay, a densely populated metropolis on the west coast of India, occupying an area of 603 square kilometres situated between latitudes 18°54' to 19°16' N and longitudes 70°47' to 73° E. Greater Bombay is, in fact, an island, joined to the mainland by bridges, and has a warm, humid climate. Census of the population is taken at regular ten-year intervals, the last been taken in March 2001. At the census 11,914,398 persons were recorded (65,77,902 males and 53,36,496 females). Immigration to Bombay continues unabated and the population now has sizeable numbers of people from every State in the Union. Greater Bombay is the only district in India, having cent percent urban population. It is the industrial heart of India and has a multi-religious and multi-lingual population, representing every state in the union, approximately 68.0% being Hindus, 16.8% Muslims, 4.5% Christians and 5.6% Neo-Buddhists and 3.6% Jains, 0.8% Parsis (Zoroastrians) and 0.5% Sikhs.

The reliability of data and quality of the registration has considerably improved. At present percentage of microscopic confirmed cases is 82% and the percentage of cases diagnosed through death certificate alone is 6.6%. The ratio of mortality / incidence cases is 52%. Registry collects information on multiple cancers as per the guidelines and definition provided by the International Association of Cancer Registries.

Registry published yearly reports regularly. The registry has published more than 100 articles in indexed journals and in monographs. The registry data is also used by public health workers for epidemiologic studies, by government for cancer control programme, by journalists for public education and by medical companies for promotion of their product. Registry records follow-up information for major primary sites for the cases registered 1982 onwards.

- * 1. Institutions listed have registered at least one percent of all cases in the registry for the combined years 1999-2000.
- * 2. The numbers and proportion listed are the minimum number of cases. Institutions could have registered / reported more cases, since duplicate registrations and non-resident/registry cases are not included.
